# Neuromorphic Engineering

## Neuro - morphic

“to do with neurons”,  
i.e. neurally inspired

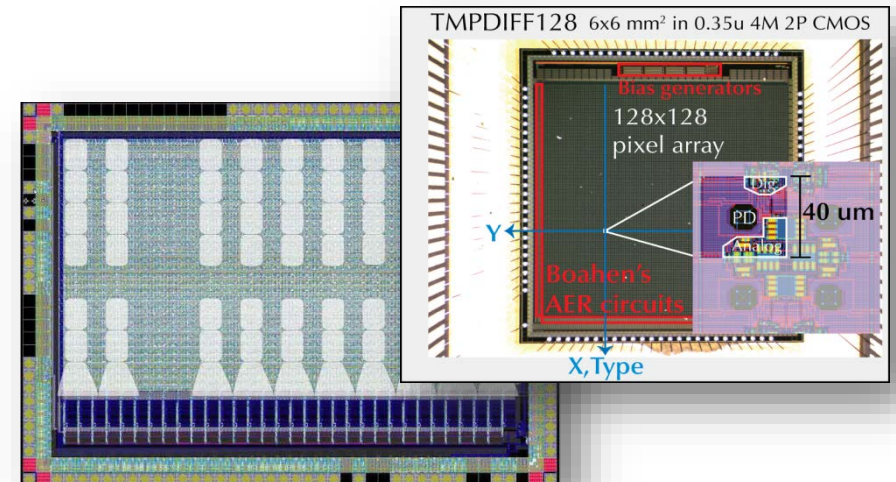

“structure or form”

Discovering key principles by which brains work  
and implementing them in technical systems  
that *intelligently* interact with their environment.

## Examples:

- analog VLSI Circuits to implement neural processing
- Sensors, such as Silicon Retinae or Cochleae
- Distributed Adaptive Control, e.g. CPG based locomotion
- Massively Parallel Self-Growing Computing Architectures
- Neuro-Electronic Implants, Rehabilitation

# Computation in Brains

## Getting to know your Brain

- 1.3 Kg, about 2% of body weight
- $10^{11}$  neurons
- Neuron growth:
  - 250.000 / min (early pregnancy)
  - ... but also ... loss 1 neuron/second

# Computation in Brains

## Getting to know your Brain

- 1.3 Kg, about 2% of body weight
- $10^{11}$  neurons
- Neuron growth:  
250.000 / min (early pregnancy)  
... but also ... loss 1 neuron/second

## “Operating Mode” of Neurons

- Analog leaky integration in soma
- Digital pulses (spikes) along neurites
- $10^{14}$  stochastic synapses
- Typical operating “frequency”:  
 $\leq 100$  Hz, typically  $\sim 10$  Hz, asynchronous

# Computation in Brains

## Getting to know your Brain

- $10^{11}$  neurons
- Neuron growth:  
250.000 / min (early pregnancy)  
... but also ... loss 1 neuron/second

## “Operating Mode” of Neurons

- Analog leaky integration in soma
- Digital pulses (spikes) along neurites
- $10^{14}$  stochastic synapses
- Typical operating “frequency”:  
 $\leq 100$  Hz, typically  $\sim 10$  Hz, asynchronous

# ... and Machines

## Getting to know your Computer’s CPU:

- 50g, irrelevant for most applications
- $2 \cdot 10^9$  transistors (Intel Itanium)
- ideally no modification over lifetime

## “Operating Mode” of CPUs

- No analog components
- Digital signal propagation
- Reliable signal propagation
- Typical operating frequency:  
Several GHz, synchronous

## Neuronal-Style Information Processing in Closed-Control-Loop Systems

- Distributed Local Information Processing
- Growing and Adaptive Networks of Computational Units
- Neuromorphic Sensor Fusion and Distributed Actuator Networks
- Event-Based Perception, Cognition, and Action

On-Board Vision-Based  
Control of Miniature UAVs

High-Speed  
Event-Based Vision

Event-Based  
Navigation

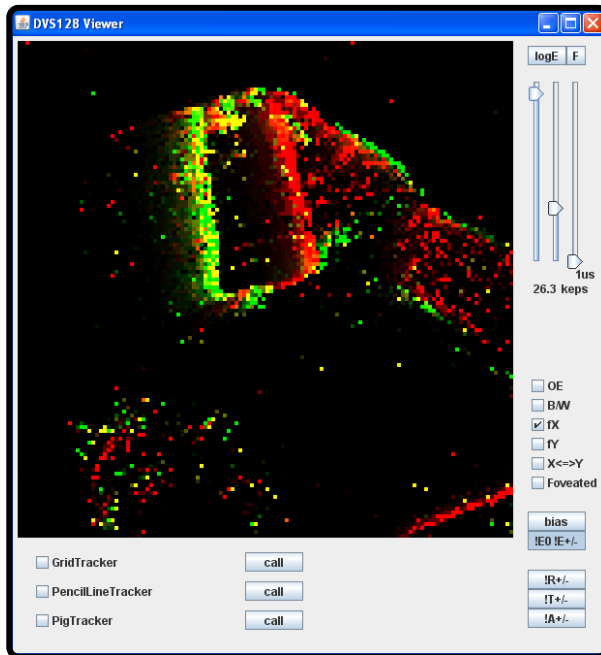

Distributed Sensing  
and Actuation

Distributed Local  
Cognitive Maps for  
Spatial Representation

# Retinal Inspired Dynamic Vision Sensor

- 128 x 128 pixels, each signals temporal changes of illumination (“events”)
- Asynchronous updates (no image frames)
- 15  $\mu$ s latency, up to 1Mevents/sec

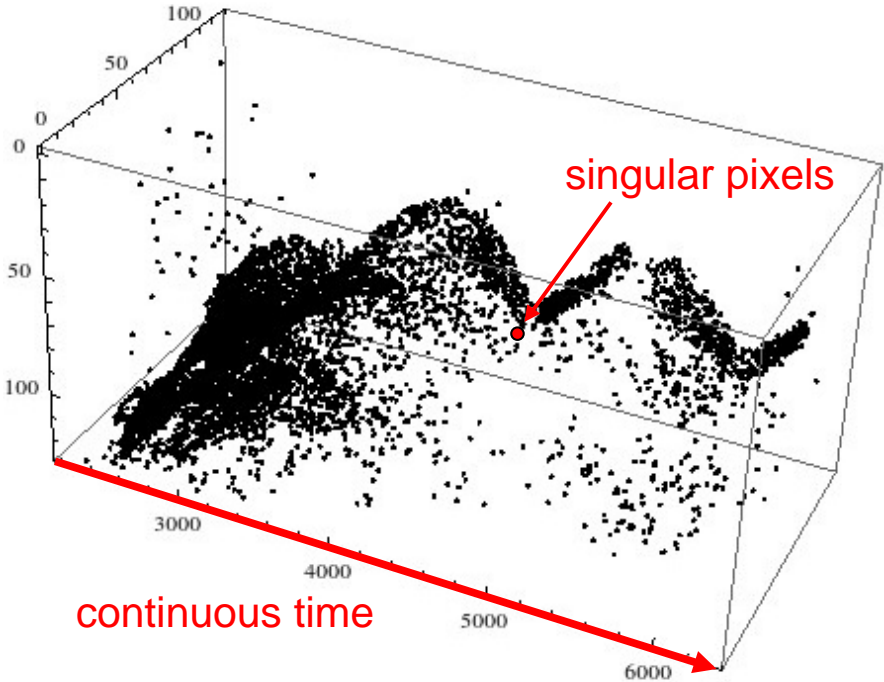

# Event - Based Vision

Frame - based

Event - based

# Event - Based Vision

## Advantages

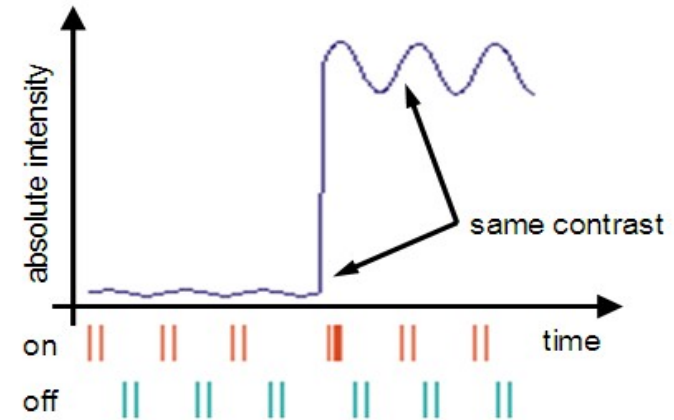

- Sparse data stream:  $\sim 0.1$  MB/s bandwidth
- $\sim 10\mu\text{s}$  response time
- Local contrast adjustment per pixel
- Automatic preprocessing

## Challenges

- Static scenes
- New vision algorithms for tracking, localization, ...

# Application Example: Tracking an Active Object

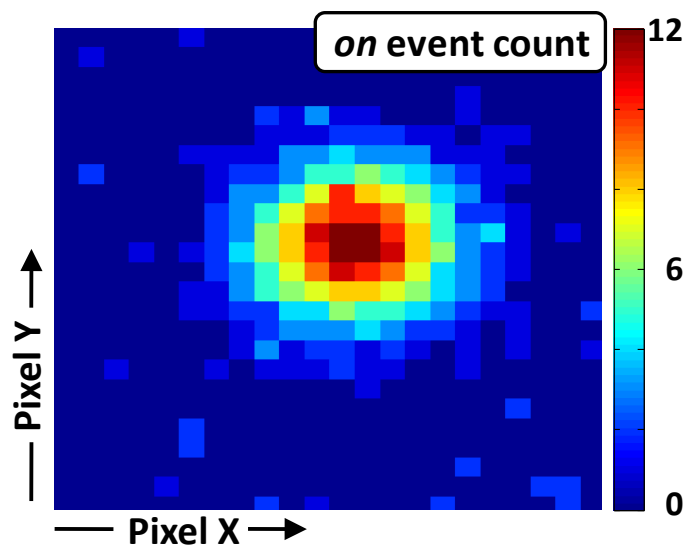

Current Tracked Position  $P_T = (7/3)$

$$P_D = \sum (P_E - P_T)^2 = 17$$

$\Delta t_E = t_E - t_M$   
 $\Delta t_{exp} = 1000\mu s$   
 $t_D = \Delta t_E - \Delta t_{exp} = 12\mu s$

Position Update:  $P_{T+1} = (1 - \eta(w_T + w_P)) \cdot P_T + \eta(w_T + w_P) \cdot P_E$

$$\mathcal{O}^{(k)}(u) = \mathcal{O}^{(k-1)}(u) + \sum_{i=1}^n s_i^{(k)} \mathcal{N}\left(u \mid \mu^{-1}(e^{(k)} | x_i^{(k)}), \sigma\right), \quad \mathcal{O}^{(0)} = 0$$

$$\mathcal{Z}^{(k)}(u) = \mathcal{Z}^{(k-1)}(u) + \|\mu(u | x_*^{(k)}) - \mu(u | x_*^{(k-1)})\|, \quad \mathcal{Z}^{(0)} = 0$$

# Application Example: SLAM for Event-Based Vision Systems

5x real time

# Event-based 3D SLAM with a depth-augmented Dynamic Vision Sensor

David Weikersdorfer, David B. Adrian,  
Daniel Cremers, Jörg Conradt

Technische Universität München, Germany

- Sensor combination: event-based dynamic vision and PrimeSense object distance
- Sparse sensory data allows real-time processing and integration
- Localization update rates of  $> 100$  Hz on standard PC
- Suitable for small autonomous mobile robots in high-speed application scenarios

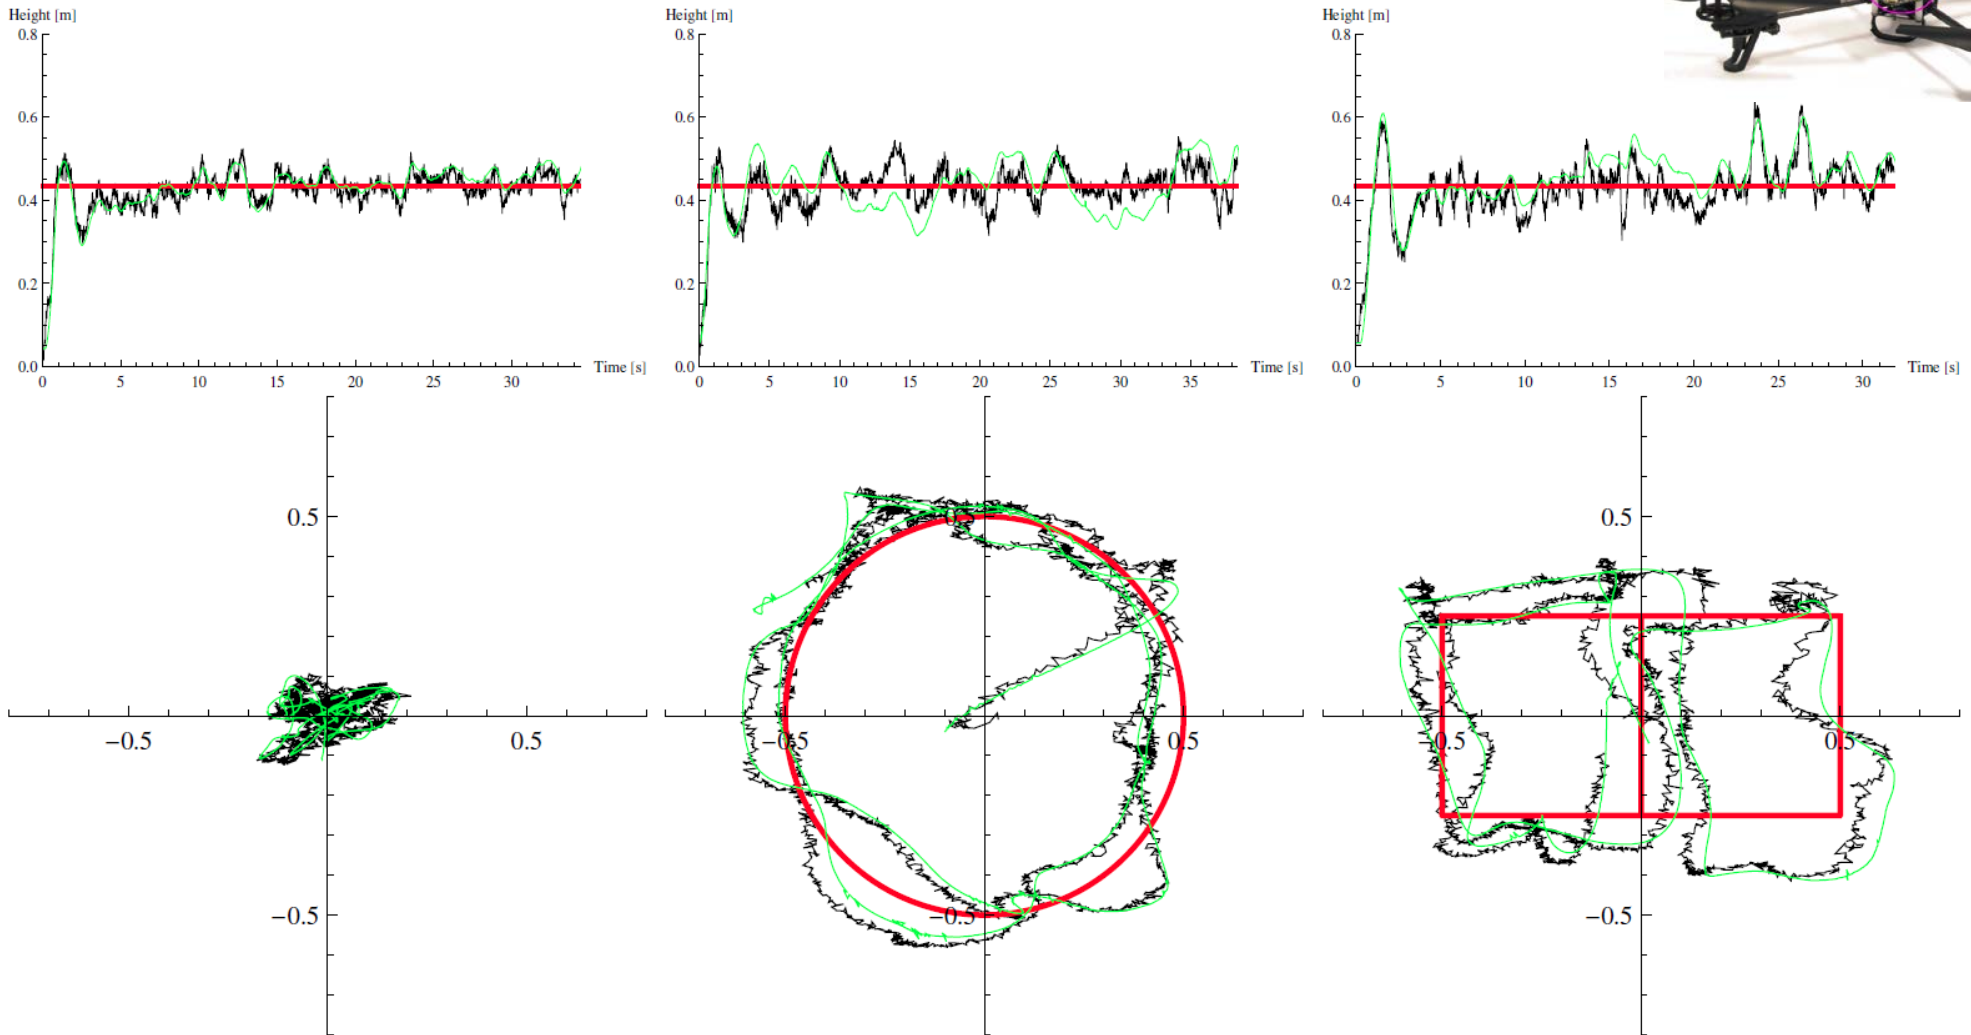

# An Autonomous Indoor Quadcopter (eb3D SLAM)

Parrot AR.Drone  
diam. ca. 80 cm

Selected hardware components : eDVS (red), Mini-PC (blue),  
Primesense IR projector (yellow) and IR camera (green), and drone control board (magenta).

# An Autonomous Indoor Quadcopter (eb3D SLAM)

Evaluation against ground truth:  
**desired trajectory**

**eb-3DSLAM**  
**ext. tracker (OptiTrack Flex13)**

# Outlook: An Autonomous Indoor Micro Quadcopter (3D SLAM)

## Key Technical Specs:

- Diameter 16cm
- Weight 38g
- Autonomy 14min

# Neuromorphic Computing Landscape

A neuro-computing renaissance

SW simulated neural networks (CPUs, GPUs).

Real-time ARM-based neural network simulator (SpiNNaker).

Fully digital *cognitive computing* chips (IBM).

Wafer-scale analog neural accelerators (BrainScaleS).

Real-time neuromorphic multi-chip emulator (NeuroGrid).

Real-time multi-neuron chip with plastic synapse neuron circuits (**neuroP**).

# SpiNNaker Project

- A million mobile phone processors in one computer
- Able to model about 1% of the human brain...
- ...or 10 mice!

## SpiNNaker Chip

Mobile  
DDR  
SDRAM  
interface

Multi-chip  
packaging by  
UNISEM Europe

# Distributed Neuronal Computation “on chip”

**Asynchronous Spiking Neural Computation Hardware  
 for low-power real-time operation in Closed-Loop Systems**

... to simulate 1 Billion  
 Spiking Neurons  
 in real-time

864 Core “Rack Version”

72 Core Evaluation

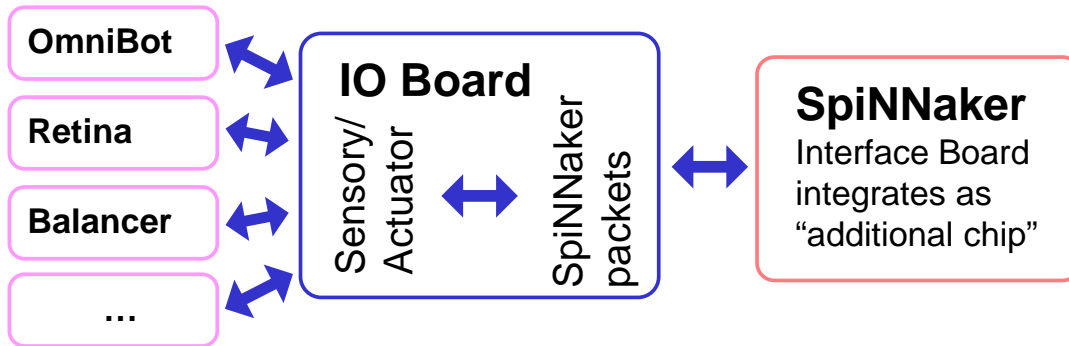

18 Core Stand-Alone Prototype

- Multi-channel spiking input and output
- Stand-alone spiking computing system
- Simulates ~20.000 neurons in real time
- Small (~20x20mm); low power (~600mW)
- Flexibly configurable, extendable, stackable

# The SpiNNaker – Robot Interface Board

## NST SpOmniBot

# Interface to Compliant Robotic Arm

SpiNN-Link:  
IO-board  
interacts with  
SpiNNaker on  
its native BUS  
and protocol

UART:  
IO-board  
UART ports to  
connect to  
peripherals

CAN:  
IO-board's  
own 4x CAN  
controller

USB/UART:  
interact with  
IO-board, live  
interaction  
with running  
simulation

Power:  
5 V, <1 A

Ethernet:  
control SpiNNaker,  
set up simulation

# Interface to Compliant Robotic Arm

# Example Projects: SpOmniBee

- 2 laterally facing retinas
- Retina events feed into SpiNNaker
- Distributed computation of local optical flow
- Global combination of optic flow
- Computation of Motor commands on SpiNNaker, send to robot

Goal:

keep SpOmnibot centered in hallway with marking, similar to Srinivasan's Bee experiments

# Application Example: Event-Based Optic Flow for Robot Control

Trajectory stabilization using event-based optic flow

A control interface for the robot, displaying two rows of data for DVS 1 and DVS 2. Each row contains four panels: DVS raw data (with red and green channels), Optic Flow X, Optic Flow Y, and X Motion / Y Motion plots. Below the data is a control panel with four sliders: Rotate Left, Rotate Right, Back, and Forward. A 'Control' checkbox is checked. There are also 'Log' and 'Reset Log' buttons.

DVS 1    Optic Flow X    Optic Flow Y    X Motion    Y Motion

DVS 2    Optic Flow X    Optic Flow Y    X Motion    Y Motion

Rotate Left    Rotate Right

Back    Forward

Left    Right

Control

Log

Reset Log

# Example Projects: Ball Balancer

- One Retina to observe the platform in top-down view
- Two motors to control platform's pan and tilt angles
- SpiNNaker Interface Board is connected to retina and motors

Goal: Keep ball (one or more!) on a certain trajectory

# Neural Principles for System Control
